

ORGANIC AIR CUSHION FILM  
MADE FROM POTATO STARCH

**AirWave Bio**

AirWave Bio air cushion films are 100% biodegradable. They are made from renewable resources, including potato starch. The potato starch blend is completely broken down by microbes in the environment and leaves no microplastic.

# AirWave Bio – biodegradable and home compostable

The unique air cushion film is suitable for packaging all products, e.g. cosmetics, pet supplies, medicines, electronic devices, sensitive components, textiles - but also food is best packed in AirWave Bio. The film thickness is minimal at 20 µm. The regular perforation allows the air cushions to be easily separated. Last but not least, the cost savings compared to paper cushions are amazing.

The disposal is done with organic waste or via compost in the garden - simple, environmentally friendly.

The AirWave Bio is suitable for the filling of small to large cavities and as an intermediate layer. The AirWave Bio is available as air cushion filler or wrapper.

**100% Airwave transport protection with 100% home compostable film.**

## Airwave type 7 for void filling and type 8 for wrapping
